- MCR Labs - Product Testing, Research, Education etc
 - 85 Spleen St Framingham MA 01701

Dosing Tip Sheets

- www.healer.com
- 4 day program to start cannabis tincture or inhalation product

Labeling of Cannabis Products

There are no standard guidelines for labeling of content for cannabis products sold on—line, in local shops or at authorized Massachusetts dispensaries. Variability of product labeling may be confusing for patients as well as clinicians who attempt to determine the amount of cannabinoid in each dose and may lead to errors. Here are some examples of cannabinoid labeling issues:

- Patient directions are not usually noted on the containers. (Start LOW and go SLOW)
- **Ratio Expression:** Expression of THC:CBD or CBD:THC is not consistent as there is no standard of which cannabinoid is listed first.
- **Percent Concentration:** Some products may be labeled with percent concentration which makes it difficult to calculate the amount of CBD or THC in the container or in each dose. The volume of the container and/or dose must be known to calculate the amount of CBD or THC. (note the percent concentration is on the box and not the container)

- In the example below the description notes each 1 ml serving contains 10mg of cannabis oil. TAC is the total amount of cannabinoid in the 1 fl. oz. container (about 30 mls)
