

What is a hernia?

A hernia is a condition in which part of an organ is displaced and protrudes or bulges through the wall of the cavity containing it. For example, the usual hernia is a lump of intestinal or fatty tissue that is pushed through a defect or weakness in the abdominal wall. Hernias are described based on the location of the hernia (inguinal, femoral, umbilical, and others).

Origin

Hernias can be caused by strenuous exercise such as lifting heavy objects, chronic coughing, damage from past injury or surgery, sports, pregnancy, constipation, weight gain, chronic lung disease, abdominal cavity fluid, and hereditary factors.

Symptoms

Symptoms can include a visible bulge, pain or discomfort, a feeling of weakness or pressure/fullness, as well as a burning or aching sensation in the affected area.

Have you been diagnosed with a hernia?

Call **978-712-1570** to schedule an appointment with our team of hernia experts. We offer both surgical and non-surgical interventions.

Beverly Hospital Hernia Center

Comprehensive Care for You

The Beverly Hospital Hernia Center offers a specialized approach to hernia care. Our team supports, treats, and guides you and your family throughout the entire process from the initial visit, therapeutic interventions, to surgery, and ultimately recovery.

Our Team

Choosing Beverly Hospital's Hernia Center means you will be receiving expert care from surgeons who have a vast range of hernia experience.

Our surgeons have received specialized training to manage all forms of hernias using the latest techniques including minimally-invasive surgery. With minimally-invasive surgery, only a few small incisions are made, which means a faster recovery time and a more cosmetically appealing result.

Specialized Care

Beverly Hospital Hernia Center offers specialized care to patients from the North Shore and beyond. In our comprehensive clinic, you will see board-certified surgeons who will determine the best treatment for you.

What types of hernias can we manage?

- Abdominal/Intestinal
- Diaphragmatic
- Epigastric
- Femoral
- Incisional
